

Time to First Follow Up Service for Community Rehabilitation and Treatment (CRT) Clients After Inpatient Psychiatric Hospitalization Discharge

David Horton, Mental Health Analyst III

February 2018

Key Findings

- The annual number of inpatient stays for CRT clients (defined by number of discharges) saw an increase in FY 2017 after trending downward since FY 2011.
- The annual number of CRT clients with inpatient stays (defined by number of unique clients with at least one discharge) also saw an increase in FY 2017 after trending downward since FY 2011.
- In FY 2017, 46% of all CRT inpatient discharges received a same-day follow-up service by their CRT programs.
- In FY 2017, 81% of CRT inpatient discharges received a follow-up service within one week of being discharged.
- DAs differed markedly in how quickly they provided follow-up services after CRT inpatient discharges.

Background

Community Rehabilitation and Treatment (CRT) is a community-based outpatient program for adults with severe and persistent mental illness. CRT programs are funded by the Vermont Department of Mental Health (DMH) and administered by 10 Designated Agencies (DAs) and 1 Specialized Service Agencies (SSA) across Vermont.

This data brief provides information on the number of days between discharge from inpatient psychiatric care and the first receipt of follow up CRT services for clients who had been enrolled in CRT prior to their inpatient psychiatric admission. This measure complements the *Follow-Up After Hospitalization for Mental Illness (FUH)* recommended by the National Committee for Quality Assurance (NCQA).

Methods

Data from two DMH databases were analyzed. The CRT Inpatient Admissions Database contains basic information on CRT inpatient stays and was used to identify all inpatient psychiatric discharges for CRT enrolled clients from FY 2011 through FY 2017. The Monthly Service Report (MSR) database contains client- and service-level data on all mental health services provided by DAs and SSAs. The Centers for Disease Control and Prevention (CDC) Link Plus software was used to identify the unique CRT clients with inpatient discharges and to determine the number of discharges for each CRT client. Link Plus was then used to link each CRT client to the Monthly Service Report (MSR) database to establish the date of the first follow up service after each inpatient discharge. The difference between inpatient discharge dates and follow up service dates was used to calculate the time between discharge and follow up.

Results

Table 1 describes the number of discharges, number of clients discharged, and the range of discharges per client for CRT psychiatric inpatient stays. Each year, most CRT clients with inpatient discharges had a total of one or two discharges, but there was a small number of clients with as many as eleven discharges per year.

Vermont Department of Mental Health – Data Brief

Table 1
CRT Psychiatric Inpatient Stays

	Number of Discharges	Number of Clients Discharged	Range of Discharges Per Client
FY2011	587	375	1 to 11
FY2012	521	326	1 to 10
FY2013	449	306	1 to 8
FY2014	348	252	1 to 4
FY2015	355	247	1 to 6
FY2016	329	239	1 to 9
FY2017	364	245	1 to 10

Table 2 lists the number of inpatient psychiatric discharges per CRT client in each fiscal year. Note that, because of the rarity of having a large number of inpatient psychiatric discharges, CRT clients with four or more discharges were collapsed into the *4 or more* category in order to protect client confidentiality.

Table 2
Number and Percent of CRT Clients by Number of Inpatient
Psychiatric Discharges

	Number of Inpatient Discharges			
	1	2	3	4 or more
FY2011	268 (72%)	60 (16%)	22 (6%)	24 (6%)
FY2012	217 (67%)	73 (22%)	16 (5%)	20 (6%)
FY2013	221 (72%)	56 (18%)	14 (5%)	15 (5%)
FY2014	183 (73%)	48 (19%)	15 (6%)	6 (2%)
FY2015	178 (72%)	49 (20%)	9 (4%)	11 (4%)
FY2016	187 (78%)	29 (12%)	16 (7%)	7 (3%)
FY2017	173 (71%)	50 (20%)	11 (5%)	11 (5%)

Each year, more than 50% of all CRT inpatient psychiatric discharges in Vermont were followed up with an outpatient CRT service within the same day. Approximately 30% of all discharges each year received a follow up CRT service within 1 to 7 days subsequent to discharge. Smaller percentages of discharges received a follow up either 8 to 30 days or more than 30 days after discharge. Each year, 2% to 4% of inpatient discharges did not receive a follow up service. Figure 1 summarizes the time between inpatient discharge and the first outpatient follow up among CRT clients across Vermont for each year of the study period.

Vermont Department of Mental Health – Data Brief

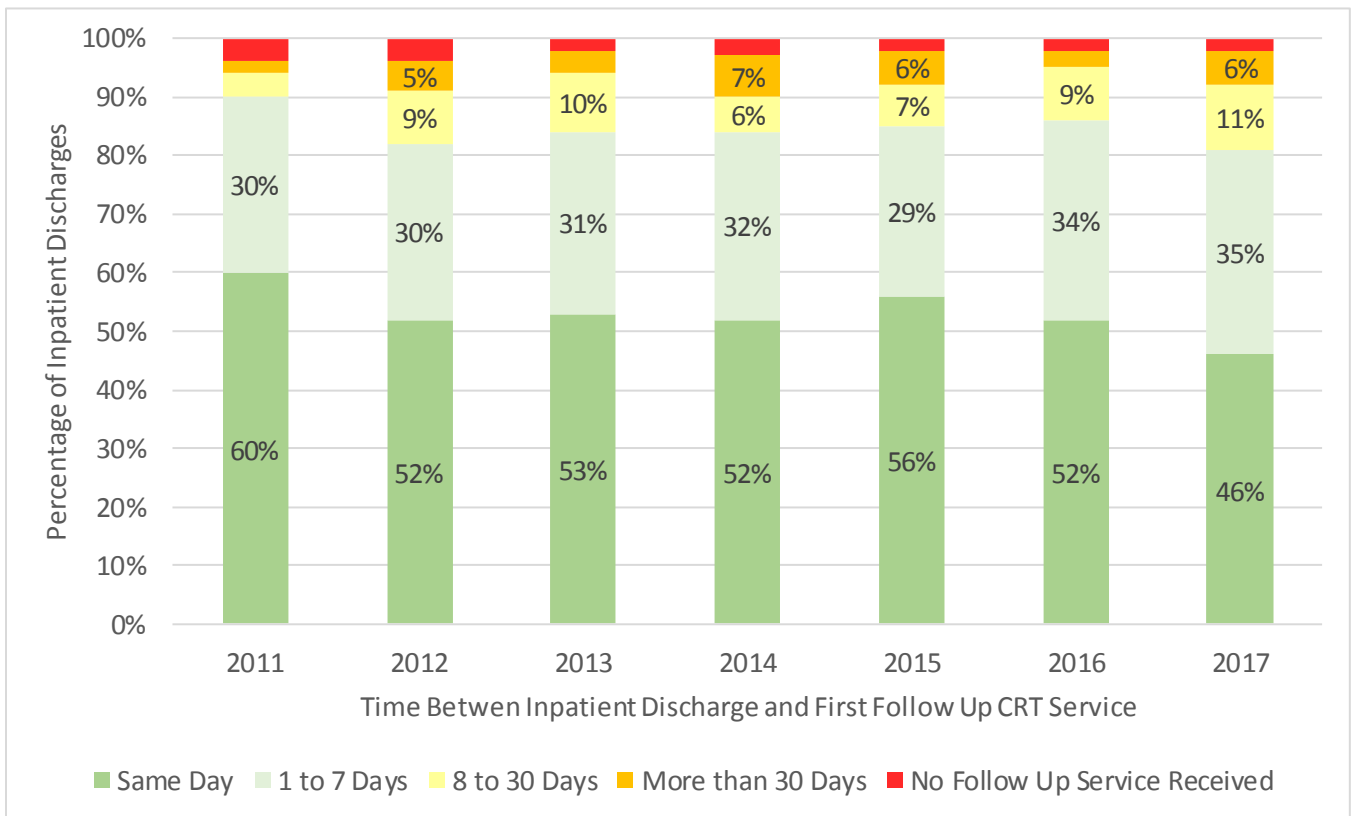

Figure 1 – Time Between Inpatient Discharge and First Follow Up CRT Service by Fiscal Year

While Figure 1 provides a useful visual representation of cumulative percent of CRT clients that fall into each of the five categories of time between inpatient discharge and the first follow up across each year of the study period, Table 3 provides the same data in greater detail (number, percent, and cumulative percent of inpatient discharges) and in tabular format.

Table 3

Number, Percent, and Cumulative Percent of Inpatient Psychiatric Discharges for CRT Client in Each Time-To-Follow-Up Group by Year

	Same Day			1 to 7 Days			8 to 30 Days			More than 30 Days			No Follow Up Service

Figure 2 presents the time between inpatient discharge and first follow up CRT service in the same manner as Figure 1, but it presents only data from FY 2017 and breaks the data out across the 10 DAs and 1 SSA that are contracted to provide mental health services across Vermont.

Vermont Department of Mental Health – Data Brief

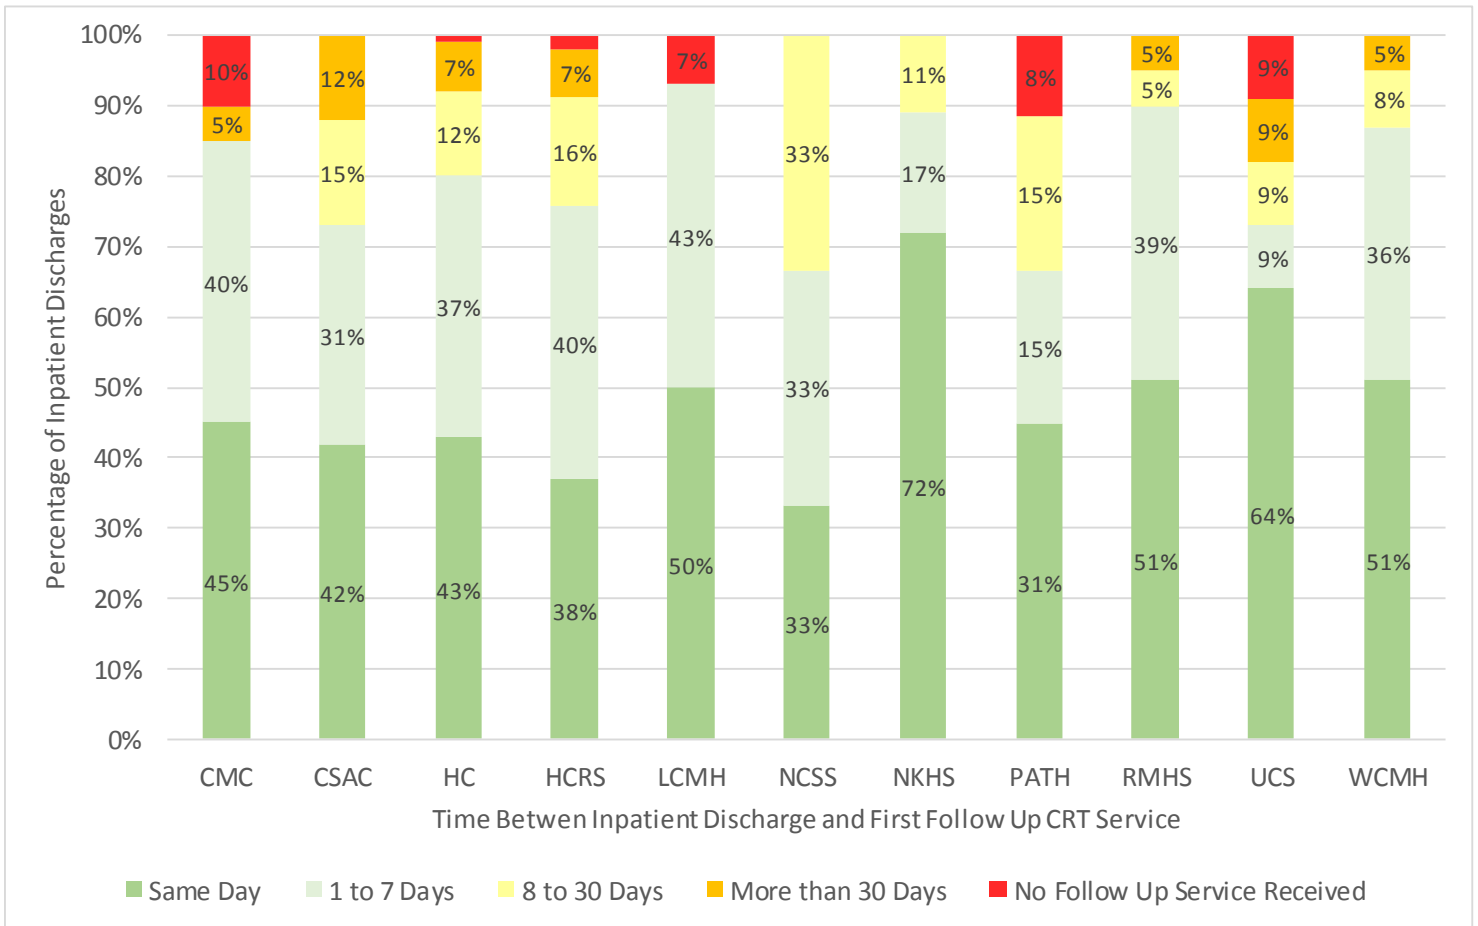

Figure 2 – Time Between Inpatient Discharge and First Follow Up CRT Service by Designated Agency, FY 2017

Table 4 presents the number and percent of inpatient discharges for CRT clients that fall into each of the five categories of time between inpatient discharge and the first follow up with an outpatient CRT service across all 10 DAs and 1 SSA in FY 2017.

Vermont Department of Mental Health – Data Brief

Discussion

The number of inpatient psychiatric discharges produced by CRT clients dropped from 587 in FY 2011 to 364 in FY 2017. Similarly, the number of CRT clients with inpatient admissions dropped from 375 in FY 2011 to 245 in FY 2017. However, there was an increase in both inpatient psychiatric discharges produced by CRT clients and CRT clients with inpatient admissions from FY 2016 to FY 2017. Each year, most CRT clients with inpatient psychiatric discharges were only hospitalized once. The percent of CRT clients with only one hospitalization remained consistent from year to year (approximately 72%). The number and percent of CRT clients with multiple psychiatric hospitalizations increased slightly from 28% in FY 2011 to 30% in FY 2017. When considering these statistics, it should be noted that Vermont's state hospital was closed in August of 2011 due to Tropical Storm Irene and this impacted the availability of inpatient psychiatric care across the state.

As Figure 1 indicates, in FY 2017 46% of all inpatient psychiatric discharges for CRT clients were followed up with an outpatient CRT service the same day as the discharges. This marks the first noteworthy decline in same day follow up across all seven years of the study period (see Table 3). On average, 32% of all inpatient psychiatric discharges for CRT clients were followed up with an outpatient CRT service one to seven days after being discharged. Taken together, these findings demonstrate that, each year, approximately 85% of clients who were receiving state-provided outpatient care prior to psychiatric hospitalization received a CRT outpatient follow up service within one week of being discharged from inpatient care. Relatively few discharges were followed up with CRT services after 8 days and approximately 3% of discharges for CRT clients were not followed up with an outpatient CRT service.

Across the last seven years, there was a statewide decrease in the percent of inpatient psychiatric discharges that received CRT follow up services on the same day as the discharge. However, DAs differed quite noticeably in how quickly they provided CRT follow up services after their clients were discharged from inpatient care (see Tables 5-15). In FY 2017, the percent of inpatient psychiatric discharges for CRT clients that were followed up with an outpatient CRT service on the same day ranged from 72% for NKHS to 31% for PATH. The percent of inpatient psychiatric discharges for CRT clients that were not followed up with an outpatient CRT service ranged from 0% for CSAC, NCSS, NKHS, RMHS, and WCMH to 10% for CMC. However, it should be noted that the DAs that serve a small number of clients may exhibit greater variability in the percent of CRT clients in each time-to-follow-up category. This is particularly true in the time-to-follow-up categories with fewer clients such as the No Follow Up category.

When seven-year trends were compared across the different DAs it became apparent that the percent of CRT clients followed up on the same day has decreased for most DAs. Of particular note, NCSS saw 36% decrease in the number of discharges followed up in the same day. Four other DAs saw a substantial decrease in the percent of discharges followed up the same day: CMC's same day follow up dropped by 20%, CSAC's dropped by 19%, and both HCRS's and LCMH's dropped by 17%. CMC and UCS saw increases in both the percent of inpatient discharges followed up after 30 days and those not followed up at all. CSAC, HCRS, WCMH, RMHS, and HC saw an increase in the percent of inpatient discharges followed up after 30 days. However, UCS followed up 11% more of its CRT clients on the day of their discharge in FY 2017 compared to FY 2011.
